Double S
Business Plan

By Sanni Arimanda and Catherine Lin

Mission

Double S helps people protect and locate important belongings through a thin, rechargeable, and easy-to-use tracking device.

Management

Sanni Arimanda and Catherine Lin will manage the company's early development. Sanni will focus on customer research, marketing, branding, partnerships, sales, and business planning. Catherine will focus on product research, supplier coordination, testing, prototype development, and operations.

Double S will work with outside engineers, software developers, manufacturers, designers, and legal advisers when specialized support is required. Before beginning commercial sales, the founders plan to register Double S as a limited liability company in Texas.

Product

Double S will initially offer one product, the **Double S Rechargeable Sticker Tracker**. The MVP is expected to include:

- Thin, flat construction
- Adhesive backing
- Bluetooth Low Energy
- Rechargeable battery
- Contact-based charging
- Built-in sound alert
- Battery-level display
- Separation alert
- Secure device pairing
- No required subscription

The MVP will use contact charging rather than full wireless charging. A small magnetic clip or charging cradle will connect to charging contacts on the tracker. This will reduce thickness, cost, heat, and design complexity. The first version will not include GPS, cellular service, or a global finding network. It will focus on nearby Bluetooth finding and separation alerts.

Market Analysis

Many people misplace small belongings, but current trackers do not fit every object. Some are too thick, require a keychain, or are designed mainly for wallets and bags. Others use disposable batteries or cannot attach directly to an item. Double S will address this gap with a thin, rechargeable tracker that sticks directly to small belongings.

The primary target market is high school and college students. Students regularly move between classrooms, homes, vehicles, activities, and workplaces while carrying small items that are easy to lose. Secondary customers include families, travelers, and working professionals.

Before placing a large production order, Double S will interview at least 50 potential customers, survey at least 200 people, test a working prototype, and measure interest at several price points. The company will also collect waitlist registrations and offer a limited preorder.

Competitive Analysis

Double S will compete with Apple AirTag, Chipolo CARD, Tile, and other Bluetooth trackers. Apple AirTag has strong brand recognition and access to Apple's Find My network, but it is not a thin adhesive sticker. Chipolo CARD is thin and rechargeable, but it is designed mainly for wallets.

Double S will compete through:

- Sticker-style attachment
- Rechargeable battery
- Thin design
- Sound and separation alerts
- No subscription
- Target price of $29.99

The Double S MVP will not offer a global tracking network. The company will clearly explain that the product is intended for nearby finding and separation alerts.

Product Development and Operations

Double S is currently in the concept and early-development stage.

The company will:

1. Define product size, battery life, sound, charging, and application requirements.
2. Build a working electronic prototype.
3. Create a smaller production-style circuit board.
4. Develop the casing and adhesive system.
5. Build the mobile application.
6. Test the tracker with potential customers.

7. Improve the design.
8. Complete battery and wireless testing.
9. Produce a pilot batch.
10. Launch an initial order of about 1,000 units.

Double S plans to use a contract manufacturer. Each tracker will be tested for Bluetooth connection, sound, charging, battery performance, application pairing, adhesive placement, and physical condition.

The company must also follow wireless, battery, shipping, privacy, and consumer-safety requirements before selling the product.

Pricing Strategy

Double S plans to sell the tracker for **$29.99**. A limited preorder price of **$24.99** may be offered to early customers.

The estimated initial production cost is approximately **$18.00 per unit**.

Cost Category	Estimated Cost
Electronics, battery, and charging parts	$8.00
Circuit board and sounder	$3.00
Casing, adhesive, and printing	$1.25
Assembly and testing	$2.25
Charging accessory	$1.50
Packaging, freight, and reserve	$2.00

Estimated total	**$18.00**

At a retail price of $29.99, estimated gross profit is $11.99 per unit before payment fees, marketing, fulfillment, customer support, and other expenses. Double S expects the unit cost to decline as production volume grows. The company will aim to reduce the cost below $14.00 per unit before expanding advertising or retail distribution.

Marketing and Sales

Double S will position the product as a thin, rechargeable tracker for the small things people cannot afford to lose.

The company will first sell through its website. This will allow Double S to test pricing, control its message, and collect direct customer feedback. Marketing will use TikTok, Instagram, YouTube, email, school events, entrepreneurship competitions, product demonstrations, referrals, and preorder campaigns. The launch will begin with a waitlist, followed by prototype testing and a limited preorder.

Funding and Financial Outlook

Double S estimates that it will need approximately **$90,000** for engineering, application development, testing, certification, legal work, initial inventory, and launch activities.

Potential funding sources include founder contributions, grants, competitions, crowdfunding, preorders, and angel investment. Double S expects to operate at a loss during development and early sales. The company may break even in Year 2 and become profitable in Year 3 if it meets its sales and cost targets of 1000 units sold in Year 1, 5000 units sold in Year 2, and 15000 units sold in Year 3.

Risks

The main risks include product thickness, short battery life, weak sound, adhesive failure, higher manufacturing costs, low customer demand, and competition from larger brands. Double S will reduce these risks through prototype testing, customer research, limited production runs, qualified suppliers, safety testing, and controlled spending.

Executive Summary

Double S is developing a thin, rechargeable Bluetooth tracker that attaches directly to small personal belongings. It is designed for objects that are too small or flat for traditional keychain-style trackers. The tracker connects to a mobile application through Bluetooth Low Energy. Users can activate a sound to locate an item nearby and receive an alert when the tracker disconnects from their phone. Double S will begin with one minimum viable product, or MVP. The company will focus on testing, improving, and launching this tracker before developing other products. The primary customers are students, families,

travelers, and working professionals. Common uses include wallets, calculators, headphone cases, identification-card holders, passport holders, remote controls, laptop sleeves, and electronic-device cases. Double S plans to sell the tracker for $29.99, with an introductory preorder price of $24.99. The estimated initial production cost is approximately $18.00 per unit for an order of about 1,000 units.
